

Question

Hypothesis

While working in a terminal-centric environment, the author noticed that most developers constantly switch between multiple terminal windows (shell, file manager, remote sessions, monitoring tools), which disrupts focus and slows down workflow. Despite spending up to 80–90% of their time in the terminal, there is no simple, native way to organize a stable and persistent terminal workspace directly on the desktop. Existing solutions either require complex configuration or do not provide a seamless terminal-first experience.

A lightweight, console-based tool that transforms the desktop into a fixed grid of terminals will reduce context switching, improve workflow consistency, and enhance productivity for terminal-oriented users.

Features

Problem

tmux	Terminal multiplexing inside a single window
i3 / sway	Full tiling window managers with complex setup
Terminator	GUI-based terminal splitting
GNU Screen	Legacy terminal multiplexer

Undoubtedly, existing tools provide powerful functionality. However, the author identified several key limitations:

1. Lack of a desktop-level terminal layout (most tools operate inside a single window)
2. Frequent manual setup of workspace on every session
3. Excessive complexity of configuration (especially for tiling window managers)
4. Lack of a simple, ready-to-use terminal workspace

In summary, the core problems are:

- context switching between terminal windows
- absence of persistent workspace
- unnecessary configuration overhead

Actuality

The author has not found a suitable lightweight solution that provides a ready-to-use, desktop-integrated terminal workspace. Existing tools either:

- focus on multiplexing rather than layout
- require full window manager replacement
- or introduce unnecessary complexity

WallTerm addresses this gap by offering a minimal and practical solution tailored for terminal-first workflows.

Purpose

The objective of the WallTerm project is to develop a lightweight, terminal-native workspace manager that integrates directly with the desktop environment. The system aims to:

1. Reduce context-switching time by organizing tools into a fixed layout

2. Provide instant access to commonly used terminal utilities

3. Eliminate the need for repetitive workspace setup

4. Keep the system lightweight and efficient

5. Ensure fast startup and minimal delay

6. Minimize configuration complexity
